

● IN PILOT

WHAT'S NEXT

Airava

Airava is in **pilot** with a small number of clinicians. This sheet is our honest view of what the product does **not do yet** and intends to build next. Every item below is **planned, not built** — the boxes are unchecked on purpose. No dates are set, and nothing here is claimed as working today.

PLANNED ADDITIONS

End-to-end encryption of records

Keyed to the therapist's identity plus a device-bound factor, so records are readable only on the therapist's own device. Today records are stored on-device but not encrypted.

SALAMA connect

Integration with the Dubai health record system.

UAE-region hosting

Migrate to Azure in the UAE once operational. Accounts are currently hosted in India, where Airava is also hiring engineers.

Regulatory registration & review

Confirm the applicable regulatory class and complete UAE PDPL counsel review before Airava handles real patient data beyond the pilot.

On-device transcription & summaries

Replace the cloud AI service so session audio and notes never leave the device.

Dual-approval key recovery

Escrowed decryption keys released only on the joint approval of the treating therapist and Airava's Chief Medical Officer.

Secure record transfer

A request-and-approval flow for handing a client's history to another practitioner.

Duplicate-record repair

An in-app way to merge or correct client records that were split by a mistyped Emirates ID.

An **unchecked box** means not built yet. Airava will only mark an item done here when it is genuinely shipped — this sheet exists to be honest about the gap, not to imply progress.
